

Deliverable 1:

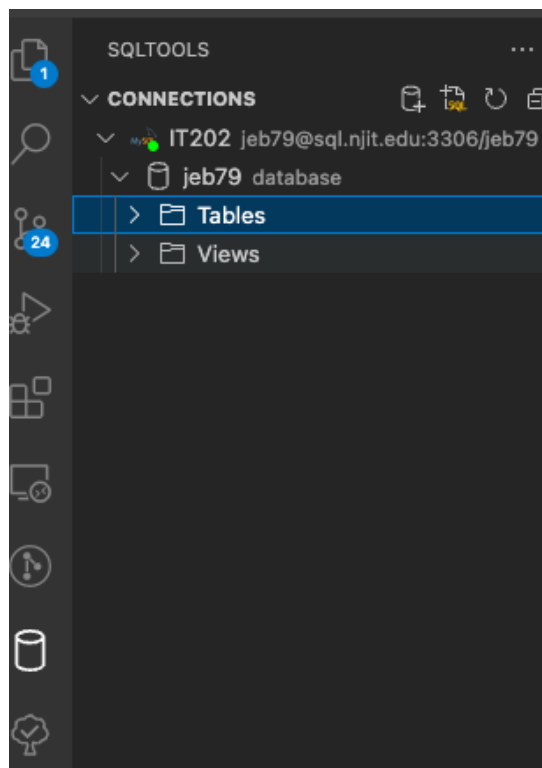

Ucid: jeb79

Date: 9/25/22

This is the screenshot of my WakaTime, MySQL, PHP Intellephense and PDF Viewer extensions.

Deliverable 2:

This is a screenshot of my own personal mySQL database connection to the mySQL NJIT servers.

Discussion:

Deliverable 3:

During this module, I learned a lot about command line actions. Through the terminal, I learned how to maneuver through different directories. Additionally, I learned a lot about github and version control in this module. In the github portion of module 1, I learned how to

make a repository for a project and then create branches within said repo for version control. In the industry, version control is an important key when working on certain portions of an application without crashing the whole application/website.

Deliverable 4:

The main issue that I ran into during this module was the adding of the zip folder into the afsSetup branch. When I directly moved the files into the afsSetup branch, there was an issue with moving files outside of the repo into the repository itself. I resolved this issue by physically clicking and dragging each file into the IT202-007 directory while in the afsSetup branch. However, now I currently have uncommitted files when I run the command "git status."
